

ON RHAMPHOCORIXA BALANODIS ABBOTT.

By J. R. DE LA TORRE-BUENO, White Plains, N. Y.

Rhamphocorixa balanodis Abbott was described from Missouri in 1912,¹ at which time the author erected for it that new genus. Subsequently, he wrote me saying he suspected it might be one of Uhler's species, *acuminata*, described in 1897,² from Illinois and Texas. To satisfy myself, this was checked up with Uhler's description cited, and the species was found to agree perfectly with it.

The synonymy becomes *Rhamphocorixa acuminata* Uhler 1897 (*Corixa*)-*balanodis* Abbott 1912.

To the localities of these two authors would be added the following: Washington, D. C. (Coll. Heidemann); Plano, Texas, "at trap light" (E. S. Tucker); Normal, Ills. (U. S. N. M., "coll. C. V. R." labelled "*Corixa scutellata*").

An Introduction to Entomology

By JOHN HENRY COMSTOCK, Professor of Entomology and General Invertebrate Zoology, Emeritus in Cornell University.

PART I—The Structure and Metamorphosis of Insects

This volume is the first part of a text-book of entomology that Professor Comstock has in preparation. It is, however, a complete treatise on the structure and metamorphosis of insects. The part now published includes four chapters. The first chapter is entitled "The Characteristics of Insects and Their Near Relatives." In this chapter the characteristics of the Arthropoda and of each of the thirteen classes of arthropods is discussed, with figures of representatives of each of these classes. The second chapter is devoted to a detailed discussion of the external anatomy of insects. The third chapter treats of the internal anatomy of insects and includes the results of recent investigations in this field. In the fourth chapter there is a detailed account of the transformation of insects, in which each of the different types of metamorphosis of insects is discussed. There is also included a bibliography and an index.

Pages, xviii + 220, with 220 illustrations. Bound in cloth. Price \$2.50 net.
